WIND TUNNEL TEST DATA REPORT

CONFIGURATION: McDonnell-Douglas Orbiter and Booster Shuttle Models; 0.00556 Scale

TEST PURPOSE: Experimental Aerodynamic Investigation of Space Shuttle Booster and Orbiter Vehicles in Close Proximity at Mach Numbers of 2.0 to 6.0

TEST FACILITY: AEDC-VKF Tunnel A

TESTING AGENCY: LARC/MSFC

TEST NO. & DATE: AEDC VA 1163; 21 through 27 April 1971

SADSAC COORDINATORS: L. L. Trimmer — ARO
D. A. Love — LMSC/HREC

PROJECT ENGINEERS: J. P. Decker — LaRC
K. L. Blackwell — MSFC
R. H. Burt — ARO

ABSTRACT

This report presents aerodynamic data obtained from a joint Langley Research Center (LaRC)/Marshall Space Flight Center (MSFC) Space Shuttle abort stage separation wind tunnel test. The .00556 scale models of the McDonnell-Douglas orbiter and booster configurations were tested in close proximity using dual balances in Tunnel A of the Von Karman Facility (VKF), Arnold Engineering Development Center (AEDC) during the time period of April 21 to April 27, 1971. Data were obtained for both booster and orbiter over an angle of attack range from -10^{o} to 10^{o} for zero degree sideslip angle. The models were tested at several relative incidence angles and separation distances and power conditions. Plug nozzles utilizing air were used to simulate booster and orbiter plumes at various altitudes along a nominal ascent trajectory. Powered conditions were 100, 50, 25 and 0 percent of full power for the orbiter and 100, 50 and 0 percent of full power for the booster. Pitch control effectiveness data were obtained for both booster and orbiter with power on and off. In addition, launch vehicle data with and without booster power were obtained utilizing a single balance in the booster model. Data were also obtained with the booster canard off in close proximity and for the launch configuration.

Plotted data for this test will be published under one data report number (DMS-DR-1108) with seven volumes as described below:

Volume	Description
I	Mach Number 5 Booster Proximity Data
II	Mach Number 5 Orbiter Proximity Data
III	Mach Number 3 Booster Proximity Data
IV	Mach Number 3 Orbiter Proximity Data
V	Mach Number 2 Booster Proximity Data
VI	Mach Number 2 Orbiter Proximity Data
VII	Interference Free Data for Orbiter and Booster, Launch Vehicle Data, and Proximity Data for Mach Numbers 4 and 6

A report containing Schlieren photographs will be published by AEDC. Schlieren photographs were taken at -10, 0, and 10 degrees angles of attack for each pitch polar.

III	Mach Number 3 Booster Proximity Data
IV	Mach Number 3 Orbiter Proximity Data
V	Mach Number 2 Booster Proximity Data
VI	Mach Number 2 Orbiter Proximity Data
VII	Interference Free Data for Orbiter and Booster, Launch Vehicle Data, and Proximity Data for Mach Numbers 4 and 6.

A report containing Schlieren photographs will be published by AEDC. Schlieren photographs were taken at -10, 0, and 10 degrees angles of attack for each pitch polar.

TABLE I. SADSAC NOMENCLATURE OF AERODYNAMIC COEFFICIENTS

COEFFICIENT	COEFFICIENT NAME	SADSAC NOMENCLATURE		
		BODY AXIS	STABILITY AXIS	WIND AXIS
C_A	Total Axial Force	CA	-	-
C_{AB}	Base Axial Force	CAB	--	-
C_{AF}	Forebody Axial Force	CAF	-	-
C_D	Total Drag Force	-	CD	CDTOTL
C_{DB}	Base Drag Force	-	CDB	CDBASE
C_{DF}	Forebody Drag Force	-	CDF	CDFORE
C_L	Lift Force	-	CL	CL
C_N	Normal Force	CN	-	-
C_Y	Side Force	CY	CY	CC
C_ℓ	Rolling Moment	CBL	CSL	CWL
C_m	Pitching Moment	CLM	CLM	CPM
C_n	Yawing Moment	CYN	CLN	CLN
L/D	Lift-To-Drag Force Ratio	-	L/D	CL/CD
L/D	Lift-To-Forebody Drag Force Ratio	-	L/DF	CL/CDF
N/A	Normal-To-Axial Force Ratio	N/A	-	-
N/A	Normal-To-Forebody Axial Force Ratio	CN/CAF	-	-

CONFIGURATIONS INVESTIGATED

The two configurations tested were the MDAC orbiter and booster, figures 4 and 5 respectively. The orbiter is basically the configuration illustrated on MDAC drawing number 255BJ0050. Modifications made on the orbiter to allow for installation of the nozzle assembly is shown in figure 4.

The booster configuration is basically the configuration designated 19A by MDAC (drawing number 256-19-0001). The body, wing, and canard of the booster model are that of configuration 19A except that the body does not have a base flare or boattail, figure 5. The vertical tails are those which were designed for the configuration designated 17 (drawing number 256-17-001).

Both the orbiter and booster models had moveable elevons with deflection angles of 0^{o}, $\pm 10^{o}$, and $\pm 20^{o}$. Geometric characteristics are shown on the following pages. Figures 4, 5, and 6 are photographs showing both models and models with associated separation hardware. Figures 5 and 6 also show the trip strip installation. For Mach 5 a grit size of #26 was utilized. However, at the beginning of the test a grit sizing study was performed which showed a slight effect on C_A only.

NOZZLE CALIBRATION

Two plug nozzle systems were designed and fabricated to simulate the rocket exhaust plume emitting from the booster and orbiter main propulsion systems during staging. Each nozzle was designed based on the gasdynamic simulation parameters established in Ref. 1. A variable area ratio capability was incorporated into both nozzle systems to permit the proper gasdynamic simulation of the full scale rocket exhaust plume at the various trajectory conditions of interest. Photographs of the nozzle hardware are shown in figures 6, 7 and 8.

Nozzle Calibration Test Objectives

The objectives of the nozzle calibration test were:

- Establish, experimentally, nozzle performance characteristics for the range of area ratio settings to be used with the booster and orbiter nozzles, respectively.
- Establish the degree of plume simulation obtained with the booster and orbiter nozzles, respectively.
- Establish a curve (based on experimental results) of nozzle exit conditions as a function of nozzle area ratio setting.

Nozzle Calibration

Calibration testing of the booster and orbiter plug nozzles was accomplished in Tunnel C of the Arnold Engineering Development Center's Von Karmon Gas Dynamics Facility. The nozzles were tested individually at a series of area ratio settings. Nozzle operating conditions (chamber pressure, P_{oj}; and chamber

temperature, T_{oj}) were maintained in a range compatible with the abort staging test conditions. A quiescent low pressure, P_b, condition was maintained in the test cell. Data recorded at each area ratio setting included: optical data to determine plume shapes; static pressure measurements on the sting surface at the nozzle exit; nozzle mass flow measurements; and pitot pressure surveys in the plume at several locations downstream of the nozzle exit plane. The various test parameters sampled at each setting were correlated during the data evaluation to establish actual nozzle performance characteristics.

In a parallel effort, analytical solutions of the nozzle flow field and associated plume were generated for various area ratio settings of the booster and orbiter models. A method of characteristics solution employing real gas thermodynamic data for air was utilized in the calculations. Analytical results for each area ratio setting included: plume shape; static pressure distribution along sting surface; and plots of constant Mach number and constant pitot pressure contours in the plume flow field. These results formed a baseline for evaluating the experimentally measured performance of the plug nozzles.

A detailed evaluation of the calibration test results has been prepared and presented in Reference 2. Included in this reference are curves relating experimentally measured nozzle performance to nozzle area ratio settings for both booster and orbiter. These curves were utilized to set the correct nozzle area ratio for exhaust plume gasdynamic simulations during the test.

TEST PROCEDURE

Abort staging was simulated by movement of the orbiter model through a matrix of points in the booster model flow field. Vertical and axial translation of the orbiter model was provided by an electrically driven remotely controlled positioning mechanism. The general arrangement of the models in the tunnel is shown in figure 3. The orbiter positioning mechanism and the booster model support were attached to the wind tunnel angle of attack system which provided ±10-degree angle of attack variation for the booster-orbiter combination. Incidence angle variation was provided by manual adjustment of the orbiter sting.

The orbiter positioning mechanism provided axial translation of approximately 17 inches and vertical translation of approximately 15 inches with respect to the booster. An automatic control system allowed a series of positions to be programmed prior to a test run. The control system had provisions for 25 different x-positions and 25 different z-positions. For these tests, however, only 9 x-positions and 8 z positions were utilized. All x and z positions except the first and last could be switched in or out of the matrix as desired.

The automatic positioning mechanism was slaved to the angle of attack mechanism so that as a pitch sweep was completed the positioning mechanism

was released to advance to the next matrix point and as the point was reached the angle of attack mechanism was released for a pitch sweep. The entire matrix was covered in this manner and about 30 seconds were required for each pitch sweep in the matrix.

Plume simulation was provided by a single torodial nozzle in each model. The nozzles were designed with variable area ratio capability to permit proper simulation of the full-scale rocket plume at the various trajectory conditions of interest. Pretest calibration of the nozzles was used to correlate area ratio settings with measured plume shapes, nozzle mass flow, and nozzle exit static pressure. Air heated to approximately 100°F was supplied to the nozzles, and separate controls for the booster and orbiter supplies were provided.

TEST FACILITY DESCRIPTION

Tunnel A is a continuous, closed-circuit, variable density wind tunnel with an automatically driven flexible-plate-type nozzle and a 40- by 40-inch test section. The tunnel can be operated at Mach numbers from 1.5 to 6 at maximum stagnation pressures from 29 to 200 psia, respectively, and stagnation temperatures up to 750°R ($M_\infty = 6$). Minimum operating pressures range from about one-tenth to one-twentieth of the maximum at each Mach number. For a more comprehensive description of Tunnel A, see Reference 3.

DATA REDUCTION

FOR SADSAC

In the continuous pitch mode of data acquisition the wind tunnel parameters and model nozzle pressures were recorded at the beginning of each pitch sweep. The outputs of both balances and the angle of attack were scanned continuously at a rate of 67 times each second. Forty scans of these inputs were averaged to compute each data point, and when combined with the pitch rate of approximately 1-degree per second, a data point was computed every 0.6 degree. Linear interpolations were made between data points to obtain the data for even increments of booster angle of attack, and the data were tabulated in 1-degree increments of booster angle of attack from -10 to +10 degrees.

Schlieren photographs were automatically taken at pre-selected angles of attack during each pitch sweep. For these tests a photograph was taken near maximum, zero, and minimum angles of attack. Opening the camera shutter provided a photograph indicator record on the data tape which was used by the computer to calculate the booster angle of attack at which the photograph was taken. The camera shutter speed combined with the model pitching rate yielded an uncertainty in the tabulated photograph angle of attack of approximately ± 0.2 degree. A report containing a summary of all schlieren photographs will be published by AEDC.

The measured force and moment data for both models were corrected for balance tares and reduced about the respective moment reference points and the body axis system. The dimensional data used to reduce the orbiter measured data to coefficient form are listed and defined below:

S_{ref} = Orbiter wing planform area = 23.689 in.^{2} (0.164 ft^2)

l_{ref} = Orbiter wing mean aerodynamic chord = 4.193 in.

b = Orbiter wing equivalent span = 6.5 in. (0.542 ft)

The moment reference point (MRP) for the orbiter data is 4.917 inches aft of the nose, on the lateral center line, and 1.390 inches below the top fuselage surface. The dimensional data used to reduce the booster measured data to coefficient form are listed below:

S_{ref} = 44.444 in.^{2} = model reference area based on a full scale reference area of 10,000 ft^2 (see Data Report DMS-DR-1054, page 6)

l_{ref} = b = 13.333 in. = model reference length based on a full scale reference length and span of 200 ft (see Data Report DMS-DR-1054, page 6)

The moment reference point applicable to the booster data is 7.528 inches aft of the model nose, on the booster lateral center line, and 1.194 inches above the bottom fuselage surface.

The ΔX and ΔZ distances were referenced to the moment reference points of the orbiter and booster and the booster body axis system. For example, the ΔX distance is parallel to the longitudinal axis of the booster and between the moment reference points on the orbiter and booster. The ΔZ is perpendicular

to the longitudinal axis of the booster and that distance between the moment reference points on the orbiter and booster. Values for ΔX and ΔZ are positive when the orbiter moment reference point (MRP) is forward and above the booster MRP. Both ΔX and ΔZ were normalized using the booster fuselage length of 16.184 inches.

The reference lengths used to reduce the orbiter data, booster data and normalize the ΔX and ΔZ data were different; these different values are listed and discussed above. The large negative values of pitching moment coefficient for the orbiter at a -0.391 value of $\Delta X/l_B$ and booster power on condition were apparent because the orbiter was in the plume of the booster.

For each dual balance test run the orbiter and booster data were separated and assembled into data sets utilizing $\Delta Z/l_B$ (SADSAC parameter name DELTAZ) as the first independent variable (IDPVAR(I)) and booster angle of attack as the second independent variable (IDPVAR(2)) (see collation sheets). Test data applicable to a $\Delta Z/l_B$ value of 10.0 are interference free data.

DATA NOMINALIZING

Varying balance and sting deflections which were caused by variations in model attitude and test conditions prevented the data from being obtained at constant values of α_I and $\Delta z/l_B$. The differences between the nominal values and the values obtained during a test run were acceptable at the higher Mach numbers because of low aerodynamic loads. However, the differences

became appreciable at the lower Mach numbers. At the lower Mach numbers (Mach numbers of 2 and 3) pitch-plane coefficients (CN, CLM, and CA) for the booster and orbiter models were cross-plotted versus α_I at each booster angle of attack and test condition to adjust the coefficients to nominal α_I values. These values were then cross-plotted versus $\Delta z/l_B$ to adjust the coefficients to nominal $\Delta z/l_B$ values. This nominalizing was accomplished with a digital computer data fairing routine which used third degree polynominals determined by the coordinates and the slope at adjacent data points.

NOMENCLATURE

(General)

SYMBOL	SADSAC SYMBOL	DEFINITION
α	ALPHA	angle of attack, angle between the projection of the wind X_w-axis on the body X, Z-plane and the body X-axis; degrees
β	BETA	sideslip angle, angle between the wind X_w-axis and the projection of this axis on the body X-Z-plane; degrees
ψ	PSI	yaw angle, angle of rotation about the body Z-axis, positive when the positive X-axis is rotated toward the positive Y-axis; degrees
ϕ	PHI	roll angle, angle of rotation about the body X-axis, positive when the positive Y-axis is rotated toward the positive Z-axis; degrees
ρ		air density; K_g/m^3, slugs/ft^3
a		speed of sound; m/sec, ft/sec
V		speed of vehicle relative to surrounding atmosphere; m/sec, ft/sec
q	Q(PSI) Q(PSF)	dynamic pressure; $1/2\rho V^2$, psi, psf
M	MACH	Mach number; V/a
RN/L	RN/L	Reynolds number per unit length; million/ft
p		static pressure; psi
P		total pressure; psi
C_p	CP	pressure coefficient; $(p-p_\infty)/q$

NOMENCLATURE (Continued)

Reference & C. G. Definitions

SYMBOL	SADSAC SYMBOL	DEFINITION
S		wing area; m^2, ft^2
S	SREF	reference area; m^2, ft^2
$\bar{c}$		wing mean aerodynamic chord or reference chord; m, ft, in (see ℓ_{ref} or LREF)
ℓ_{ref}	LREF	reference length; m, ft, in.; (see $\bar{c}$)
b_{ref}	BREF	wing span or reference span; m, ft, in
A_b		base area; m^2, ft^2, in^2
c. g.		center of gravity
MRP	MRP	abbreviation for moment reference point
	XMRP	abbreviation for moment reference point on X-axis
	YMRP	abbreviation for moment reference point on Y-axis
	ZMRP	abbreviation for moment reference point on Z-axis

NOMENCLATURE (Continued)

Axis System General

SYMBOL	DEFINITION
F	force; F, lbs
M	moment; M, in-lb

Subscript	Definition
N	normal force
A	axial force
L	lift force
D	drag force
Y	force or moment about the Y axis
Z	moment about the Z axis
X	moment about the X axis
s	stability axis system
w	wind axis system
ref	reference conditions
∞	free stream conditions
t	total conditions
b	base

NOMENCLATURE (Continued)

Body & Stability Axis System

SYMBOL	SADSAC SYMBOL	DEFINITION
		Body Axis System
C_N	CN	normal force coefficient; F_N/qS
C_A	CA	axial force coefficient; F_A/qS
C_{A_b}	CAB	base axial force coefficient; $\left[-1\right]\left[(p_b - p_\infty)/q\right](A_b/S)$
C_{A_f}	CAF	forebody axial force coefficient; $C_A - C_{A_b}$
C_n	CYN	yawing moment coefficient; $M_Z/qS\ b_{ref}$
C_ℓ	CBL	rolling moment coefficient; $M_X/qS\ b_{ref}$
		Common to Both Axis Systems
C_m	CLM	pitching moment coefficient; $M_Y/qS\ \ell_{ref}$
C_y	CY	side force coefficient; F_Y/qS
		Stability Axis System
C_L	CL	lift force coefficient; F_L/qS
C_D	CD	drag force coefficient; F_D/qS
C_{D_b}	CDB	base drag coefficient
C_{D_f}	CDF	forebody drag coefficient; $C_D - C_{D_b}$
C_n	CLN	yawing moment coefficient; $M_{Z,s}/qS\ b_{ref}$
C_ℓ	CSL	rolling moment coefficient; $M_{X,s}/qS\ b_{ref}$
L/D	L/D	lift-to-drag ratio; C_L/C_D
L/D_f	L/DF	lift to forebody drag ratio; C_L/C_{D_f}

Surface Definitions

SYMBOL	SADSAC SYMBOL	DEFINITION
i_t	HORIZT	horizontal tail incidence; positive when trailing edge down; degrees
δ		symmetrical surface deflection angle; degrees; positive deflections are:
	AILRON	aileron - total aileron deflection; (left aileron - right aileron)/2
	CANARD	canard - trailing edge down
	ELEVON	elevon - trailing edge down
	ELEVTR	elevator - trailing edge down
	FLAP	flap - trailing edge down
	RUDDER	rudder - trailing edge to the left
	SPOILR	spoiler - trailing edge down
	TAB	tab - trailing edge down with respect to control surface
δ		antisymmetrical surface deflection angle, degrees; positive trailing edge down:
	AIL-L	left aileron - trailing edge down
	AIL-R	right aileron - trailing edge down
	ELVN-L	left elevon - trailing edge down
	ELVN-R	right elevon - trailing edge down
	SPLR-L	left spoiler - trailing edge down
	SPLR-R	right spoiler - trailing edge down

SURFACE SUBSCRIPTS	DEFINITION
a	aileron
b	base
c	canard
e	elevator or elevon
f	flap
r	rudder or ruddervator
s	spoiler
t	tail

ADDITIONS AND CHANGES TO NOMENCLATURE

SYMBOL	SADSAC SYMBOL	DEFINITION
i_T		tail incidence positive when trailing edge down, deg
V		velocity of vehicle relative to surrounding atmosphere; m/sec, ft/sec
α_B	ALPHAB	booster angle of attack, angle between the projection of the wind X_w-axis on the body X, Z-plane and the body X-axis; deg
β	BETA	sideslip angle, angle between the wind X_w-axis and the projection of this axis on the body X-Z-plane; deg
γ		ratio of specific heats
Γ	DIHDRL	wing dihedral angle; deg
ρ		air density; K_g/m^3, slugs/ft^3
α_I	ALPHAI	incidence angle between the orbiter and booster on the XZ plane
α_O	ALPHAO	orbiter angle of attack, $\alpha_O = \alpha_B + \alpha_I$
PWR_B	BSTPOW	booster power, percent of full thrust
PWR_O	ORBPOW	orbiter power, percent of full thrust
δ_{eB}	ELVBST	booster elevon deflection angle, positive is trailing edge down
δ_{eO}	ELVORB	orbiter elevon deflection angle, positive is trailing edge down

SYMBOL	SADSAC SYMBOL	DEFINITION
X/l_B	DELTAX	distance between the MRP on the orbiter and booster measured parallel to the longitudinal axis of the booster, positive when the orbiter MRP is forward of the booster MRP, the distance has been normalized with respect to the booster fuselage length (16.184 inches)
Z/l_B	DELTAZ	distance between the MRP on the orbiter and booster measured normal to the longitudinal axis of the booster, positive when the orbiter MRP is above the booster MRP, the distance has been normalized with respect to the booster fuselage length (16.184 inches)

TABULATED DATA LISTING

A tabulated data listing, consisting of all aero data sets, both original and those created in arriving at the plotted material to be presented subsequently, is available as an addendum to this report. The tabular listing is made up in two sections:

(a) a brief summary list of all data sets containing the identifier, the descriptor, and the resident dependent variables.

(b) a full list of all data sets containing all resident or selected aerodynamic coefficients of the data sets as well as the above mentioned information.

The listing is currently sent on limited distribution to the following organizations:

NASA AMES	Mr. V. Stevens
NASA MSC	Mr. Ray Nelson
AEDC	Mr. L. L. Trimmer
LMSC/HREC	Mr. D. A. Love
NASA LaRC	Mr. J. P. Decker
NASA MSFC	Mr. K. L. Blackwell

If copies of this listing are desired, please contact the above or the cognizant SADSAC personnel who, for this data, is:

J. L. Glynn
Department 2780
Chrysler Corporation Space Division
New Orleans, La. 70129

(504) 255-2304

ABSTRACT

This report presents aerodynamic data obtained from a joint Langley Research Center (LaRC)/Marshall Space Flight Center (MSFC) Space Shuttle abort stage separation wind tunnel test. The .00556 scale models of the McDonnell-Douglas orbiter and booster configurations were tested in close proximity using dual balances in Tunnel A of the Von Karman Facility (VKF), Arnold Engineering Development Center (AEDC) during the time period of April 21 to April 27, 1971. Data were obtained for both booster and orbiter over an angle of attack range from -10^{o} to 10^{o} for zero degree sideslip angle. The models were tested at several relative incidence angles and separation distances and power conditions. Plug nozzles utilizing air were used to simulate booster and orbiter plumes at various altitudes along a nominal ascent trajectory. Powered conditions were 100, 50, 25 and 0 percent of full power for the orbiter and 100, 50 and 0 percent of full power for the booster. Pitch control effectiveness data were obtained for both booster and orbiter with power on and off. In addition, launch vehicle data with and without booster power were obtained utilizing a single balance in the booster model. Data were also obtained with the booster canard off in close proximity and for the launch configuration.

Plotted data for this test will be published under one data report number (DMS-DR-1108) with seven volumes as described below:

Volume	Description
I	Mach Number 5 Booster Proximity Data
II	Mach Number 5 Orbiter Proximity Data
III	Mach Number 3 Booster Proximity Data
IV	Mach Number 3 Orbiter Proximity Data
V	Mach Number 2 Booster Proximity Data
VI	Mach Number 2 Orbiter Proximity Data
VII	Interference Free Data for Orbiter and Booster, Launch Vehicle Data, and Proximity Data for Mach Numbers 4 and 6

A report containing Schlieren photographs will be published by AEDC. Schlieren photographs were taken at -10, 0, and 10 degrees angles of attack for each pitch polar.
